

Quantum Field Theory: Introduction

Jaume Guasch

Departament de Física Quàntica i Astrofísica
Universitat de Barcelona

2021-2022

What is Quantum Field Theory?

- Field Theory:
Theory of Fields (space-time functions), e.g.: Classical Electrodynamics: $\partial_\mu F^{\mu\nu} = 0$
- Quantum Field Theory (QFT):
Application of Quantum Mechanics to Field Theory
- Historically, it appears in the context of:
Quantum Mechanics + Relativity
⇒ Relativistic QFT, as used in e.g. particle physics
- Non-relativistic QFT also exists:
⇒ Condensed matter
- Present lectures:

Relativistic QFT, applications to particle physics

Metric & vectors

$$\begin{aligned}
 g^{\mu\nu} &= (1, -1, -1, -1) \\
 x^\mu &\equiv (x^0, \vec{x}) \equiv (x^0, x^i) \equiv (x^0, \mathbf{x}) \\
 x^2 &\equiv x^\mu x_\mu = (x^0)^2 - \mathbf{x}^2 \\
 p^2 &\equiv p^\mu p_\mu = \left(\frac{E}{c}\right)^2 - \mathbf{p}^2 = m^2 c^2 \\
 xp &= p^\mu x_\mu = x^0 p^0 - \mathbf{x} \cdot \mathbf{p}
 \end{aligned}$$

Natural Units: $\hbar = c = 1$

$$\begin{aligned}
 p^2 &\equiv p^\mu p_\mu = E^2 - \mathbf{p}^2 = m^2, \\
 e^{-iEt/\hbar} &= e^{-iEt} \\
 [E] &= [x]^{-1} = [t]^{-1} \\
 \text{Lagrangian} &L = [E] \\
 \text{Action} &S = \int dt L = \text{no units} \\
 \text{Lagrangian density: } \mathcal{L} : &S = \int d^4x \mathcal{L} \Rightarrow \mathcal{L} \equiv [E]^4 \\
 \frac{\partial}{\partial x^\mu} &\sim \frac{1}{x^\mu} \sim [E]
 \end{aligned}$$

Conversion constants

$$\begin{aligned}\hbar c &= 197.32 \text{ MeV} \cdot \text{fm} \simeq 200 \text{ MeV} \cdot \text{fm} \\ 1 \text{ fm} &\simeq 10^{-15} \text{ m} \equiv \text{proton size} \\ 1 \text{ barn} &= 100 \text{ fm}^2 = 10^{-28} \text{ m}^2 \\ (\hbar c)^2 &= 0.389 \text{ GeV}^2 \cdot \text{mbarn} \simeq 0.4 \text{ GeV}^2 \cdot \text{mbarn} \\ \text{mbarn} &\simeq \frac{1}{0.4} \text{ GeV}^{-2} = 2.5 \text{ GeV}^{-2} \\ 10 \text{ mbarn} &\simeq 25 \text{ GeV}^{-2}\end{aligned}$$

Why QFT?

Relativistic QM:

- Non-relativistic free-particle:

$$\hat{E} = \frac{\hat{\mathbf{p}}^2}{2m} \Rightarrow i \frac{\partial \phi}{\partial t} = -\frac{\nabla^2}{2m} \phi, \quad (\hat{E}, \hat{\mathbf{p}}) = i \left(\frac{\partial}{\partial t}, -\nabla \right)$$

- Relativistic free-particle:

$$\begin{aligned}\hat{E}^2 - \hat{\mathbf{p}}^2 &= m^2 \\ -\frac{\partial^2 \phi}{\partial t^2} + \nabla^2 \phi - m^2 \phi &= 0 \\ -\partial^\mu \partial_\mu \phi - m^2 \phi &= 0\end{aligned}$$

Klein-Gordon equation

$$\partial^\mu \partial_\mu \phi + m^2 \phi \equiv \square \phi + m^2 \phi = 0$$

2nd order in $t \Rightarrow$ 2 solution for each energy: e^{-iEt} , e^{+iEt}
 \Rightarrow **Negative energy** solutions!

Plane waves:

$$\phi_p = e^{\pm i(Et - \mathbf{p} \cdot \mathbf{x})} = e^{\pm i p^\mu x_\mu} = e^{\pm i p x}$$

We can write a **probability current**:

$$J^\mu = i(\phi^* \partial^\mu \phi - (\partial^\mu \phi^*) \phi)$$

The **probability density**:

$$J^0 = i(\phi^* \partial_t \phi - (\partial_t \phi^*) \phi)$$

not positive definite \Rightarrow no probability interpretation!

- QM offers **no explanation of light “*quanta*”**
particles are *quantized* into *waves* (fields), but **Electromagnetism** is treated as a **classical “field”**, with a quantum ad-hoc rule $E = h\nu$!
- QM offers **no explanation of anti-particles**
- QM offers **no explanation of particle creation**
- Levels of description of light/particles

Light	Particles	
Geometrical Optics Fermat principle	Classical Mechanics Action principle	linear trajectory
Maxwell eqs.	Schrödinger eq.	wave
Light Quanta $E = h\nu$ Creation	???	???

\Rightarrow **Quantum Field Theory**

- The objects to quantize are the **Fields**: wave functions of QM.
- Need to study **Classical Field Theory**
- Study its symmetries, specifically:
Lorentz & Poincaré symmetries of special relativity
